### Description

The ST2G3236 is a dual supply, low-voltage CMOS 2-bit bus transceiver produced with sub-micron silicon gate and five-layer metal wiring C<sup>2</sup>MOS technology. Designed for use as an interface between a 3.3 V bus and a 2.5 V or 1.8 V bus in mixed 3.3 V/1.8 V, 3.3 V/2.5 V and 2.5 V/1.8 V supply systems, it achieves high speed operation while maintaining the CMOS low power dissipation.

This IC is intended for two-way asynchronous communication between data buses, and the direction of data transmission is determined by DIR inputs. The A-port interfaces with the 3 V bus, and the B-port with the 2.5 V and 1.8 V bus.

All inputs are equipped with protection circuits to protect against static discharge, giving them 2 kV of ESD immunity and transient excess voltage.

## 1.1 Truth table

Table 2. Truth table

Inputs		Function		Output
$\overline{OE}$	DIRn	A BUS	B BUS	
L	L	Output	Input	B => A
L	H	Input	Output	B <= A
H	X	High-Z	High-Z	HIGH-Z

## 1.2 Application notes and recommendations

- Once the device is enabled ( $\overline{OE} = \text{low}$ ), even if the input is floating, output may be either on high or low logic level only, not in a high-impedance state. Output is in a high-impedance state only when  $\overline{OE} = \text{high}$ .
- Unused I/O channel should be connected to GND or to the corresponding supply.
- The  $\overline{OE}$  and DIRn block is powered by  $V_{CCB}$  and these input logic levels are referenced to  $V_{CCB}$ . The  $\overline{OE}$  and DIRn input high level can be equal to or greater than  $V_{CCB}$ , up to  $V_{IHB \text{ max}}$ .
- Any input high level can be higher than the corresponding input supply voltage, up to  $V_{IHA \text{ max}}$  ( $V_{IHB \text{ max}}$ ).

Example:

$V_{CCA} = 1.8 \text{ V}$ ,  $V_{CCB} = 2.6 \text{ V}$ ,  $\overline{OE} = \text{Low}$ , DIRn = Low (B → A direction)

==> if I/O Bn = 3 V, I/O An = 1.8 V

- If  $V_{CCA} = V_{CCB} = 0 \text{ V}$  and  $\overline{OE} = 0 \text{ V}$ , An and Bn are isolated even if there is a signal on An or Bn.
- If the ST2G3236QTR is used in a UART application, there is a possibility of floating input condition if the cable is disconnected, therefore a pull-down resistor is recommended on the input port.

## 1.3 Recommended power-up sequence

- Apply power to either  $V_{CC}$ .
- Apply power to the  $\overline{OE}$  input and to the respective data inputs. This may occur at the same time as step 1.
- Apply power to the other  $V_{CC}$ .
- Drive the  $\overline{OE}$  input LOW to enable the device.

## 1.4 Recommended power-down sequence

- Drive the  $\overline{OE}$  input HIGH to disable the device.
- Remove power from either  $V_{CC}$ .
- Remove power from the other  $V_{CC}$ .

### 3 Electrical ratings

Stressing the device above the rating listed in the absolute maximum ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
